

Code Review Checklist 1/2

Implementation

- ☐ Does this code change do what it is supposed to do?
- ☐ Can this solution be simplified?
- ☐ Does this change add unwanted compile-time or run-time dependencies?
- ☐ Was a framework, API, library, service used that should not be used?
- ☐ Was a framework, API, library, service not used that could improve the solution?
- ☐ Is the code at the right abstraction level?
- ☐ Is the code modular enough?
- ☐ Would you have solved the problem in a different way that is substantially better in terms of the code's maintainability, readability, performance, security?
- ☐ Does similar functionality already exist in the codebase? If so, why isn't this functionality reused?
- ☐ Are there any best practices, design patterns or language-specific patterns that could substantially improve this code?
- ☐ Does this code follow Object-Oriented Analysis and Design Principles, like the Single Responsibility Principle, Open-Close Principle, Liskov Substitution Principle, Interface Segregation, Dependency Injection?

Logic Errors and Bugs

- ☐ Can you think of any use case in which the code does not behave as intended?
- ☐ Can you think of any inputs or external events that could break the code?

Error Handling and Logging

- ☐ Is error handling done the correct way?
- ☐ Should any logging or debugging information be added or removed?
- ☐ Are error messages user-friendly?
- ☐ Are there enough log events and are they written in a way that allows for easy debugging?

Dependencies

- ☐ If this change requires updates outside of the code, like updating the documentation, configuration, readme files, was this done?
- ☐ Might this change have any ramifications for other parts of the system, or backward compatibility?

Security and Data Privacy

- ☐ Does this code open the software up for security vulnerabilities?
- ☐ Are authorization and authentication handled in the right way?
- ☐ Is sensitive data like user data, credit card information securely handled and stored?
- ☐ Is the right encryption used?
- ☐ Does this code change reveal some secret information like keys, passwords, or usernames?
- ☐ If code deals with user input, does it address security vulnerabilities such as cross-site scripting, SQL injection, does it do input sanitization and validation?
- ☐ Is data retrieved from external APIs or libraries checked accordingly?

Performance

- ☐ Do you think this code change will impact system performance in a negative way?
- ☐ Do you see any potential to improve the performance of the code?

Usability and Accessibility

- ☐ Is the proposed solution well designed from a usability perspective?
- ☐ Is the API well documented?
- ☐ Is the proposed solution (UI) accessible?
- ☐ Is the API/UI intuitive to use?

Code Review Checklist 2/2

Readability

- ☐ Was the code easy to understand?
- ☐ Which parts were confusing to you and why?
- ☐ Can the readability of the code be improved by smaller methods?
- ☐ Can the readability of the code be improved by different function/method or variable names?
- ☐ Is the code located in the right file/folder/package?
- ☐ Do you think certain methods should be restructured to have a more intuitive control flow?
- ☐ Is the data flow understandable?
- ☐ Are there redundant comments?
- ☐ Could some comments convey the message better?
- ☐ Would more comments make the code more understandable?
- ☐ Could some comments be removed by making the code itself more readable?
- ☐ Is there any commented out code?

Testing and Testability

- ☐ Is the code testable?
- ☐ Does it have enough automated tests (unit/integration/system tests)?
- ☐ Do the existing tests reasonably cover the code change?
- ☐ Are there some test cases, input or edge cases that should be tested in addition?

Experts Opinion

- ☐ Do you think a specific expert, like a security expert or a usability expert, should look over the code before it can be committed?
- ☐ Will this code change impact different teams? Should they have a say on the change as well?

Exercise

- Which parts of the checklist are you already considering?
- Which aspect aren't you focusing on during code reviews and why?
- Do you think some aspects are more important than others? Why? Why not?
- Do you feel you would benefit from additional training in some areas (e.g., security, accessibility)?
